

a switching arrangement interconnected between said battery and said first electric lamp in a first position, and interconnected between that same battery and said second electric lamp in a second position of said switching arrangement.

Please add new claims 79-83:

79. (new) An electric light source as in claim 38 wherein said second electric lamp is oriented substantially parallel to said first electric lamp, and said first and second electric lamps are pointed in the same direction.

80. (new) An electric light source, comprising in combination:
a reflector having a focal point;
a lens mounted in front of said reflector;
a first electric lamp having a filament at said focal point;
a second electric lamp extending into said reflector on a side of said first electric lamp, wherein said first and second electric lamps are oriented substantially parallel to each other and pointed in the same direction toward said lens;
a battery; and
a switching arrangement interconnected between said battery and said first electric lamp in a first position, and interconnected between that same battery and said second electric lamp in a second position of said switching arrangement.

81. (new) An electric light source, comprising in combination:
a reflector having a focal point, said reflector further having first and second openings formed therein, said first opening located at the center of said reflector, and said second opening located to the side of said first opening;
a first electric lamp positioned in said first opening in said reflector and having a filament at said focal point; and

a second electric lamp including a refractive lens, said second electric lamp recessed in said second opening in said reflector such that substantially only said refractive lens of said second electric lamp is exposed in said reflector.

82. (new) An electric light source as in claim 81, including:
a movable housing for said reflector and said first and second lamps;
a switching arrangement having a switch actuator coupled to said moveable housing.

83. (new) An electric light source as in claim 81 wherein said second electric lamp is oriented substantially parallel to said first electric lamp, and said first and second electric lamps are pointed in the same direction.
